

SPEC: custom production management software

To meet the growing demand for production environment management software and electronic resource data planning, Spiromatic has created a dedicated software development team. The team's first product line, SPEC, is a custom software suite to manage production environments. The software can be adapted to individual customer needs as part of the company's consultancy service.

"Before 2018, we used to get third parties to develop these solutions for our customers," explains Software Architect Domien Brosens. "But we became more and more aware that we had to be more flexible. The need for software-assisted management of materials, articles, recipes and production orders varies a lot across food processing companies. With in-house expertise and our new development capacity, we can now meet all our customers' expectations."

Current solutions offered by SPEC include recipe management systems, production batch planning and control, seamless interfaces with customer ERP and EMS systems, and more. In the near future, SPEC will also roll out applications to log and process production line parameters so that preventive maintenance programs can be optimized.

//

*SPEC includes recipe management,
production batch planning and control, and much more.*
